The Acting Secretary of the Interior, in formal properties.

The Acting Secretary of the Interior, in formal properties.

The Acting Secretary of the Interior, in formal properties.

The Acting Secretary of the Interior, in formal properties.

The Acting Secretary of the Interior, in in cometary science more universal and the science was deeper philosophical import than has ever at gaseous.

What would be the effect upon the earth if the comet should strike it? years history is unanimous that comets have been by the majority of people considered as harbingers of the ire of Heaven, the "horrid aids of advanced science, we shall gain more ront" of wars, the dethronement of rulers, the dissent of nations and the dissolution of dynasties. If the ultra scientific imagine for a noment that superstition is dead concerning omets, they are woefully mistaken. The old poet is still believed in who wrote-

"The blazing star, Threst'ning the world with famine, plague and War:
To princes, death; to kingdoms, many curses;
To all estates, inevitable losses;
To all estates, inevitable losses;
To herdsmen.rot; to ploughmen; hapless seasons;
To sailors, storms; to cities, civil transons." Here for a time, however, we leave speculaon to make record of actual facts learned at the Washington Observatory last night. For the most part, these facts, gleaned from the richlyultured minds of Admiral Davis, Professor Newcomb and Professor Holden, will be preented in narrative form as preferable in this miles. case to that of the regular interview, yet a poron must necessarily involve the latter, and miles. for all of it short paragraphs will sufficiently indicate the nature of the questions asked. Turning to Professor Holden, he was asked

or give us a true definition of a comet, and the following is substantially his reply:

A comet may be said to consist of three marts: The "comet seeker," that is to say, a small telescope used for seeking or discovering comets, discloses in the first instance a faint, uminous speck. This gradually increases and in fifer a short time a nucleus makes its appearance. This nucleus is generally circular, someancer This nucleus is generally circular, some-times oval and on some occasions it has a radi-ated appearance. The size and brilliancy of the comet increases quickly and in equal ratio.

COMMTABY ORBITS.

COMMTABY ORBITS.

The cometary orbit of the comet of 1729 is the greatest ever known, and is 383,890,000 of miles, perihelion distance: the smallest ever he comet increases quickly and in equal ratio. In the comet increases quickly and in equal ratio. In the comet increases in length and from some comets it has spread across even a third part of the visual heavens.

In its approach to the sun its pathway is a company of the comet of the come In its approach to the sun its pathway is a cursilinear one; sometimes this pathway hardly differs from a straight line. The pathway for some a straight line. The pathway for some a straight line is the pathway for some straight line. The pathway for some straight line is the pathway for some straight line.

day time; the great majority of them, how-ever, are invisible to the naked eye day or night. The identity of comets are not determined by physical peculiarities of size and shape. Th elements composing them have to be compared and calculated, and you may accept the conusion as a safe one that with each revolutio f a comet its original splendor is decreased. MATTER OF COMETS.

The matter, the solid substance composing comets, is exceedingly small sud light. To such an extent is this true that they pass near planets without disturbing them. To flustrate: The comet of 1770, in its sweeping and terrible advance upon the sun, got intertwined, mixed up, with the satellites of Jupiter, and could not get away for nearly four months, but this had no sensible effect upon them. That same not get away for nearly four months, but this had no sensible effect upon them. That same comet came within 1,400,000 miles of the earth. Now, if its quantity had been equal to the earth, it would, by the power of attraction, have caused the earth to revolve in an orbit much larger than its present and real one, and thereby adding hours to the length of our day. The idea that danger can happen to our earth from comets is an absurd one. Even ad-mitting that the matter of comets is solid, as-tronomers have abundant reasons for this be-itef.

On the other hand, bowever, the planets influence comets. Take the comet referred to— that of 1770. Its original elliptical orbit required for its complete revolution only five and a half years, but it has never been seen since 1770. Undoubtedly, the influence of the planet, Jupiter, completely changed the char-acter of its orbit or pathway, and sent it on a journey of billions of miles through the illimitable spaces.

Whether comets are self-luminous or not as-

tronomers have not well determined. It is more than probable that they shine by reflected light. This interesting problem will, no doubt, REMARKABLE COMETS.

Under this head of inquiry reference was made only to the remarkable comets of the present century. These are the comets of 1864, 1862, 1861, 1869, 1858, 1842 and 1811. That of 1864 was very remarkable for the tremendous size of its head. That of 1862 was distinguished for its great number of luminous lets and ever-changing emanations. That of distinguished for its great number of luminous jets and ever-changing emanations. That of 1801 created a profound sensation. With the possible exception of Venus, its light surpassed that of any fixed star or planet, and when, on the 30th of June, a portion of the earth encountered the effects of its tail, a yellow, phosphorescent glare obscured even the light of the sun.

ing splendor, even reflecting a yellow sheen upon the snow. It is probable that this comet did much to revive superstition concerning them. Mr. Miller, the head of the Church of the Second Adventists, had prophesied the destruction of the world and the second coming destruction of the world and the second coming of Christ about this time, and his followers all believed the presence of the comet truly indicated the near approach of the final judgment day. If the chroniclers of that time are to be believed, those who expected to be caught up in the air to meet their couning Lord used to put on white ascension robes, go out on the tops of their houses and wait in the cold all night.

announced by a comet.

The Emperor Conrad set out for Palestine
May, 1147, and his departure was preceded by

multiplied. Enough are given from rule times down to the genius of Napoleon to show that there is a deep-rooted, ingrained superstition existing among the people of every nation and clime concerning comets.

THE MEANING OF UNUSUAL WORDS. As far as possible scientific words and phrases have been avoided in preparing the above ar-ticle, and possibly it is quite unnecessary to explain the few used, but the word aphelion means the point of a planet's or comet's orbit which is most distant from the sun. Perihelion means the point which is nearest to the sun. A parabolic orbit is one whose axis is parallel night.

The comet of 1811, all things considered, perhaps the most celebrated one of modern times, was periodic in its character, and has an orbit of 3,055 years. It shone with terrific splendor for many weeks.

A parabolic orbit is one whose axis is parameted to the sides of a cone, and hyperbolic means craggerating or diminishing beyond the fact. These few explanations will render the information given above entirely clear to all readers, and will not be regarded by any as a work of supercrostation. of supererogation.

missioner. Andrew H. Baker plead gullty, and was held in \$500 ball for his appearance at court; Wm. G. Ellegood and Samuel Maraball were discharged; Wm. Ellegood, W. Alton and Wm. Crosby were each held in \$1,000 ball. The hearing of Joseph Ellegood, the remaining prisoner, was postponed.

How is the orbit of a comet computed!
